Editors

For editing our code we recommend to use one of these programs:

- Atom
- Sublime Text
- NotePad++

Set the TAB size to 2.

Getting started

Files structure:

Let's install our template. Download any FTP client. I recommend using Filezilla. After that, find 3 inputs on the top of a program.

A screenshot of the FileZilla client's top connection bar. It contains four input fields labeled 'Host:', 'Username:', 'Password:', and 'Port:'. To the right of these fields is a 'Quickconnect' button with a dropdown arrow.

Type your host, username and password. This data must be provided by your hosting provider. Of course if yours hosting supports FTP connection. After Quick connect you'll see a folder with your site.

Filename	Filesize	Filetype	Last modified	Permissions	Owner/Gro...
..					
email		File folder	7/12/2016 12:5...	drwxr-x--x	2753 2753
etc		File folder	7/12/2016 2:17:...	drwxr-xr-x	2753 2753
logs		File folder	8/17/2016 3:50:...	drwxr-x--x	2753 2753
mod-tmp		File folder	7/12/2016 12:5...	drwx--S---	2753 2753
tmp		File folder	7/12/2016 12:5...	lrwxrwxrwx	2753 2753
www		File folder	7/12/2016 2:16:...	drwxr-x--x	2753 2753
.codepage	12	CODEPAGE...	8/24/2015	-rw-r--r--	2753 2753

Go to the "www" folder. Folder names might be different, so in this case you need just find the index.html file in some of the folders. If you found, just drag & drop all files from the "User Version" folder to your site folder. Rewrite the index.html file.

Most of hosting services have their own installation instructions, they will be more exact then mine, so I recommend read them.

HTML structure

This template contains 22 HTML files:

- Vertical versions (without –hor postfix)
 - index-fade-slider-light.html
 - index-image-light.html
 - index-interactive-light.html
 - index-rotator-light.html
 - index-swiper-slider.html
 - index-video-local-light.html
 - index-video-vimeo-light.html
 - index-video-youtube-light.html
 - index-zoom-slider-light.html
- Horizontal versions (with –hor postfix)
 - index-fade-slider-light-hor.html
 - index-image-light-hor.html
 - index-interactive-light-hor.html
 - index-rotator-light-hor.html

- index-swiper-slider-hor.html
- index-video-local-light-hor.html
- index-video-vimeo-light-hor.html
- index-video-youtube-light-hor.html
- index-zoom-slider-light-hor.html
- Blog pages
 - blog-grid-full-light.html
 - blog-grid-light.html
 - blog-single-light.html

The vertical index files structure:

```
<div class="preloader">...

<!-- Write your code here-->
<header class="jm-head" id="home">...

<div class="sections" id="fullpage">
<div class="vertical-menu common-menu">...

<section id="about" class="section">...

<section id="skills" class="section">...

<section id="education" class="section">...

<section id="services" class="section">...

<section id="experience" class="section">...

<section id="portfolio" class="section">...

<section id="contacts" class="section">...

<section id="blog" class="section">...
```

The horizontal index files structure:

```
<div class="preloader">⋮

<div class="vertical-menu ver-hidden common-menu">⋮

<div class="sections hor-layout" id="fullpage">
  <!-- Write your code here-->
  <header class="jm-head" id="home">⋮

  <section id="about" class="section">⋮

  <section id="skills" class="section">⋮

  <section id="education" class="section">⋮

  <section id="services" class="section">⋮

  <section id="experience" class="section">⋮

  <section id="portfolio" class="section">⋮

  <section id="contacts" class="section">⋮

  <section id="blog" class="section">⋮
</div>

<div class="portfolio-details">⋮
```

JavaScript

This template imports 2 types of JavaScript:

- Plugins (in the “libs” folder)
- Just Me Scripts (in the “js” folder)
 - For vertical indexes
 - Common.js
 - Progress-dark.js
 - Progress-grey.js
 - Progress-light.js
 - For horizontal indexes
 - Common-hor.js
 - Progress-dark-hor.js
 - Progress-grey-hor.js
 - Progress-light-hor.js
 - For common header settings
 - Slider-fade.js
 - Slider-swiper.js
 - Slider-zoom.js
 - Static-interactive.js
 - Static-rotator.js
 - Static-video.js

Main part customizations

First of all, you should choose the header layout:

- Static Image
- Interactive Image
- Text slideshow (Rotator)
- Swiper Slider
- Fade Slider

- Zoom Slider

Also you should choose the way of scrolling: Horizontal or Vertical.

Find the index-*.html you need. For example, if you would like to choose the Static Image with horizontal scrolling, choose the index-image-light-hor.html file. Rename this file to index.html.

Color scheme

After that you need to choose the color scheme: Dark, Grey, Light. If you have chosen the last one, you can skip the color changing section below.

Open the index.html file

find this line (among 0 – 40 lines):

```
<link rel="stylesheet" href="css/LightScheme/preloader-colors.css" media="all">
```

Replace the “Light” by the “Dark” or “Grey”.

Then scroll down

find this line (among 750 – 850 lines):

```
{"src" : "js/progress-light.js", "async" : false},
```

Replace the “light” by “dark” or “grey”

Then scroll down

find these lines (among 800 – 870 lines):

```
loadCSS("css/LightScheme/layout-static-colors.css");
```

```
loadCSS("css/LightScheme/static-image-colors.css");
```

```
loadCSS("css/LightScheme/sections-colors.css");
```

Replace the “Light” by the “Dark” or “Grey”.

Check the result!

Image changes

Let’s change the logo.

Go to the “img” folder. If you have chosen the “Dark” or “Grey” versions than replace the “dark-logo.png” and the “menu-dark-logo.png” by your SQUARE logo. In other case replace the “light-logo.png” and “menu-light-logo.png”. Other images you can change the same.

Add your portfolio in the PDF version

Find this line inside the #about section (among 100 – 150 lines):

```
<a href="" class="download-btn">download resume as pdf format</a>
```

Put your file inside the “User Version” folder and change this line by the following way:

```
<a href="" download="your-file-name" class="download-btn">download resume
```

Skills progressbars changes

Open the progress-*.js file depending on your choice concerning the way of scrolling and a color scheme. Find this line (among 1 - 20):

```
text: {  
  value: "75",  
}  
});
```

Replace the “75” by your percentage value. You can repeat this action for all of round progress bars.

Open the index.html file

Find these lines inside the #skills section (among 150 – 200 lines):

```
<div class="progress-bar first-bar" role="progressbar" style="width:0%" data-new-width="80%">  
  <span class="left">.Net Microsoft</span><span class="right">80%</span>  
</div>
```

Replace “80%” by your percentage value in two places. You can repeat this action for all of line progress bars.

Services icons changes

Open the index.html and find this line (among 260 – 300 lines):

```
<div class="item">  
  <div class="icon-mobile2 icon"></div>  
  <div class="text-description">
```

Replace the “icon-mobile2” by the any icon from this list:

<https://icomoon.io/#preview-free>

Services counter changes

Open the progress-*.js file depending on your choice concerning the way of scrolling and a color scheme. Find this line (among 85- 100):

```
var firstAnim = new CountUp("first-num", 0, 125, 0, 10);
```

Replace "125" by your value. You can repeat this action for all counters.

Contacts icons changes

Open the index.html. Find this line inside the #contacts section (among 620 – 660 lines):

```
<div class="icon-wrapper">
  <i class="fa fa-phone"></i>
</div>
```

Replace the "fa-phone" by the any icon from this list:

<http://fontawesome.io/icons/>

You can do the same with social media icons below. Also replace the link address:

```
<a href="my-link" class="item"><i class="fa fa-facebook"></i></a>
```

Form changes

Out contact form works on JS and PHP. Open the common.js or the common-hor.js depending on the way of scrolling and change this line:

```
alert("Thank you!");
```

If you want another message after form submit.

After that open the mail.php and change this line:

```
//Type your email instead of "yourmail@yourdomain"
$recipient = "yourmail@yourdomain";
```

Replace this email by yours.

Video header changes

Open index.html. If you have chosen the vimeo version than find this line:

```
<video id="header-bg-video" autoplay loop muted>
  <source src="https://player.vimeo.com/external/158148793.hd.mp4?s=8e87
</video>
```

And replace this SRC by yours.

If you are using the youtube version than find this line:

```
<div id="bgndVideo"
  data-property="{videoURL: 'https://www.youtube.com/watch?v=9lyDsIgtuvE',
</div>
```

And replace this URL by yours.

If you are using the local version just upload your video to the "img/video" folder. After that go to the index.html and find this line:

```
<div class="video-container">
  <video id="header-bg-video" autoplay loop muted>
    <source src="img/videos/sri-lanka.mp4#t=4" type="video/mp4">
  </video>
</div>
```

And replace the SRC by yours.

Blog customizations

First of all you should change the menu links in your blog. The version you have returns people on the previous page he visited (when they click on menu links). It works, but sometimes people visit your blog without having to go to it on your main website. In this case everything will work incorrectly.

Blog section is separated on 2 pages: Full blog and Single blog. Also you can choose between full-page grid blog and basic grid blog which includes blog sidebar.

Go to blog-single-light.html and find these lines:

```
45     <div class="sections" id="fullpage">
46       <div class="vertical-menu common-menu">
47         <i class="fa fa-bars"></i>
48         <div class="menu-img"></div>
49         <div class="menu-content">
50           <a href="javascript:history.back();">Back to blog</a>
51         </div>
52       </div>
```

Replace "javascript:history.back();" by your path to full blog page. Usually it is:

"<your domain>/blog-grid-light.html" or "<your domain>/blog-grid-full-light.html"

(depends on your choice).

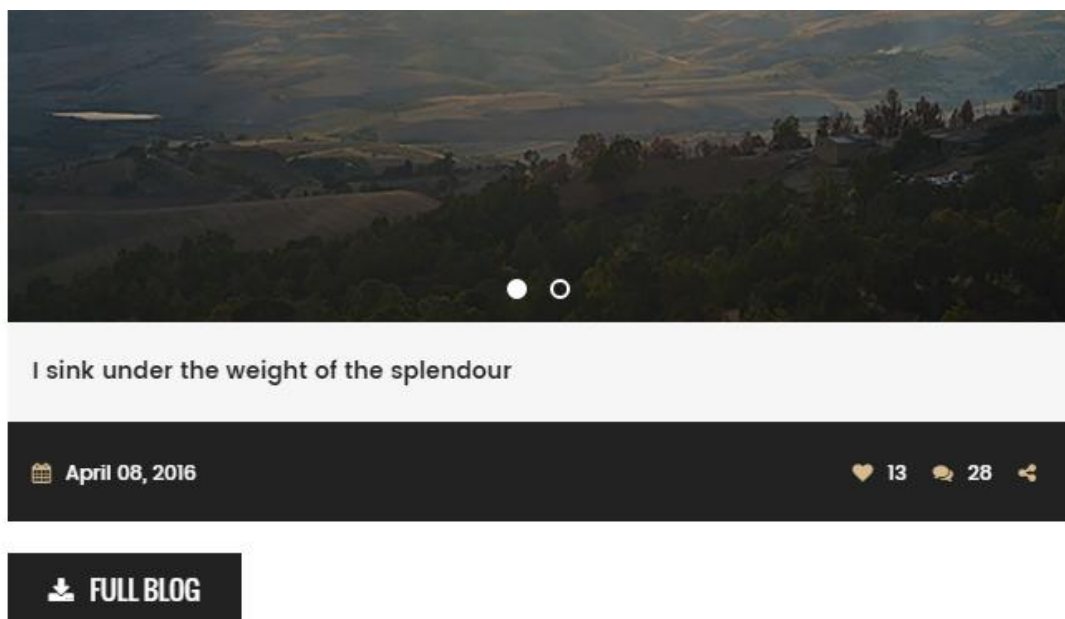

Go to blog-grid-light.html or blog-grid-full-light.html (depends on your choice) and find these lines:

```
45     <div class="sections" id="fullpage">
46         <div class="vertical-menu common-menu">
47             <i class="fa fa-bars"></i>
48             <div class="menu-img"></div>
49             <div class="menu-content">
50                 <a href="javascript:history.back();">Home</a>
51                 <a href="javascript:history.back();">About</a>
52                 <a href="javascript:history.back();">Skills</a>
53                 <a href="javascript:history.back();">Experience</a>
54                 <a href="javascript:history.back();">Education</a>
55                 <a href="javascript:history.back();">Services</a>
56                 <a href="javascript:history.back();">Portfolio</a>
57                 <a href="javascript:history.back();">Contacts</a>
58                 <a href="javascript:history.back();">My blog</a>
59             </div>
60         </div>
```

Replace “javascript:history.back();” by your path to your main part of site. It is usually:

“<your domain>”, like wayconomy.ru or usanews.com

Also you should have a working button on your main part of site, which will direct on the full blog page.

It is very simple. Go to your index.html file and find these lines:

```
782      <a href="blog-grid-light.html" class="download-btn">Full blog</a>
783      <a href="#"></a>
```

Replace the “blog-grid-light.html” by “blog-grid-full-light.html” if you have chosen this option. Or just leave it in its place if you want this button to direct on “blog-grid-light.html”.

How to change the colors scheme of my blog?

It was described earlier. Look the 8th page of our documentation. The color scheme changing is the same. But on blog pages you don’t need to change the common-*.js file, because it isn’t included.

Plugins were used
